

USA & Australia thrashed by simultaneous superstorms - Predicted by WeatherAction, driven by solar activity

The monster thunder-blizzard trashing USA and Super cyclone Yasi [BELOW] simultaneously pounding Queensland around Jan 31st & Feb 1st/2nd were caused by the same solar-magnetic activity effects and were predicted to within a day from 3 weeks ahead by Piers Corbyn of Weather Action using solar activity [Nothing to do with CO2!]

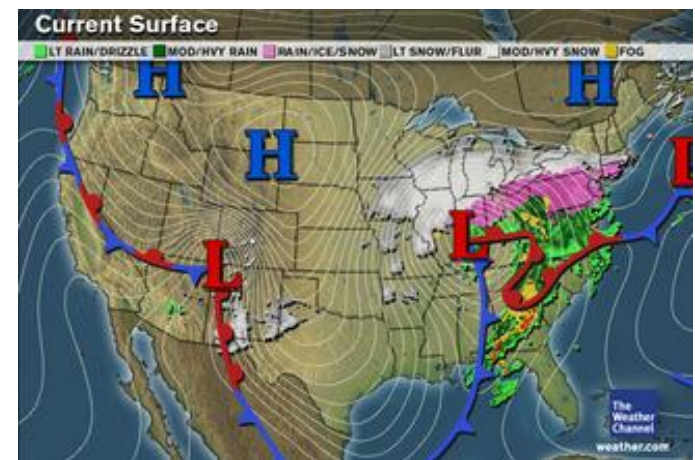

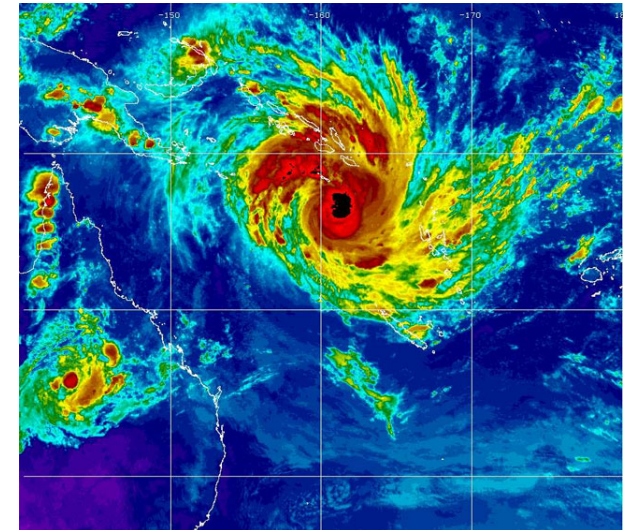

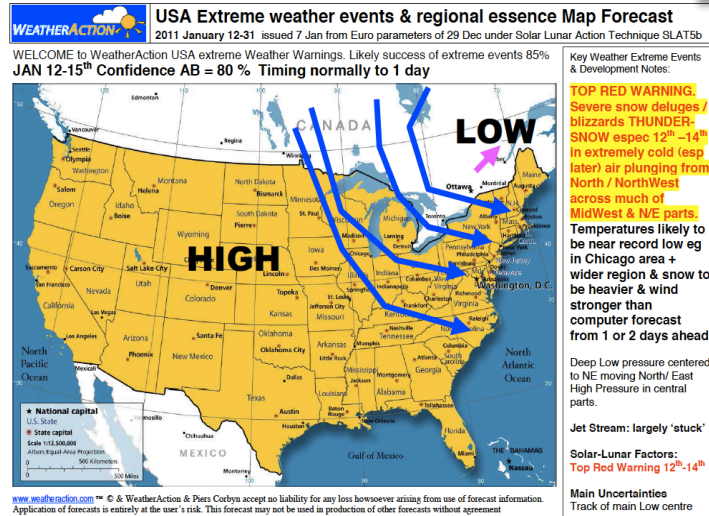

The Sun – Earth particle connections were greatly enhanced around 25th Jan by a significant 'hole' in the Earth's magnetic shield (magnetosphere) enabling solar particles to flood in giving astounding Aurorae on 25/26th <http://bit.ly/hfVkJc> and shifts of the jet streams and extreme weather events in following days.

FORECASTS: EVENTS

28-31 Jan 2011 Confidence AB=80%
TWO Tropical Cyclone Formations likely Most probable regions – Near Madagascar / Central South Indian Ocean AND /or NE of Queensland in Ocean – landfall risk unclear.

Piers Corbyn astrophysicist of WeatherAction said “We are very pleased with this success. The Mid West & NE USA superstorm is an extension of our forecast for such an event to develop from around our **TOP RED WARNING of 28th-30th Jan and we predicted the same Top Red period, but 28-31 for Australia, would see a Tropical cyclone form &/or rapidly develop NE of Queensland**”.
